

Wingdow® Seat Hardware Details

Suction Cup

The suction cups that come with Wingdow® Seat are the very best available—the same used in industrial applications. The cups are built to withstand UV light and are guaranteed to hold securely to the window, while allowing you to remove the unit easily for cleaning. The length of each suction cup assembly can be adjusted so that the unit can be brought closer to—or positioned farther from—the glass, allowing you to install Wingdow® Seat over window trim, mullions and other obstacles.

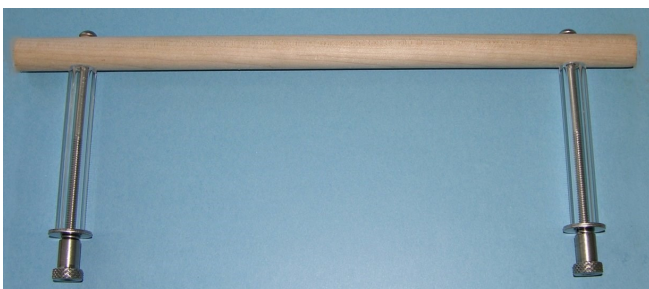

Rubber Bottom Foot

Wingdow® Seats also come with a set of rubber-tipped feet that cushion the bottom of the Wingdow® Seat and protect window sills and sashes from scratching. The feet also provide additional support and stability for Wingdow® Seats installed over sills and sashes—although they are NOT required to support the weight of the Wingdow® Seat. The suction cups alone are more than sufficient to hold the Wingdow® Seat securely to the glass and support the weight of both Seat and bird.

Perch

The perch that comes with Wingdow® Seat is made of hardwood dowel. The stainless steel legs of the perch are encased in plastic for added strength and protection. The perch attaches to the unit by means of stainless steel thumbnuts and can be easily unscrewed from the unit for cleaning or replacement. The

medium and large Wingdow® Seats have two sets of holes at the bottom of the unit, allowing you to position the perch where it is most comfortable for your bird. Manzanita, dragonwood, and textured (non-slip) PVC perches are also available at extra cost. Custom perches can also be built if you need something special for your bird.
